

1784. Check if Binary String Has at Most One Segment of Ones

Solved 

Easy

 Topics

 Companies

 Hint

Given a binary string `s` **without leading zeros**, return `true` if `s` contains **at most one contiguous segment of ones**. Otherwise, return `false`.

Example 1:

Input: `s = "1001"`

Output: `false`

Explanation: The ones do not form a contiguous segment.

Example 2:

Input: `s = "110"`

Output: `true`

Constraints:

- `1 <= s.length <= 100`
- `s[i]` is either `'0'` or `'1'`.
- `s[0]` is `'1'`.

Python:

#translated w the help of AI

class Solution:

```
def checkOnesSegment(self, s: str) -> bool:
    return "01" not in s
```

JavaScript:

```
var checkOnesSegment = function(s) {
    let count = 0;

    for (let i = 0; i < s.length; i++) {
```

```
    if (s[i] === '1') {  
  
        while (i < s.length && s[i] === '1') {  
            i++;  
        }  
  
        if (count > 0) {  
            return false;  
        }  
  
        count++;  
    }  
}  
  
return true;  
};
```

Java:

```
class Solution {  
    public boolean checkOnesSegment(String s) {  
        return !s.contains("01");  
    }  
}
```
