 Hint

You are given an integer n .

Define its **mirror distance** as: $\text{abs}(n - \text{reverse}(n))$ where $\text{reverse}(n)$ is the integer formed by reversing the digits of n .

Return an integer denoting the mirror distance of n .

$\text{abs}(x)$ denotes the absolute value of x .

Example 1:

Input: $n = 25$

Output: 27

Explanation:

- $\text{reverse}(25) = 52$.
- Thus, the answer is $\text{abs}(25 - 52) = 27$.

Example 2:

Input: $n = 10$

Output: 9

Explanation:

- `reverse(10) = 01` which is 1.
- Thus, the answer is `abs(10 - 1) = 9`.

Example 3:

Input: $n = 7$

Output: 0

Explanation:

- `reverse(7) = 7`.
- Thus, the answer is `abs(7 - 7) = 0`.

Constraints:

- `1 <= n <= 109`

Python:

class Solution:

def mirrorDistance(self, n: int) -> int:

rev, x=0, n

while x>0:

 x, r=divmod(x, 10)

 rev=10*rev+r

return abs(rev-n)

JavaScript:

// Added using AI

```
var mirrorDistance = function(n) {  
  const revnum = (a) => {  
    if (Math.floor(a / 10) === 0) return a ;  
    const rev = String(a).split("").reverse().join("") ;  
    return parseInt(rev, 10) ;  
  };  
  return Math.abs(n - revnum(n)) ;  
};
```

Java:

```
class Solution {  
  static public int mirrorDistance(int n) {  
    int rev=0;  
    for(int x=n; x>0; x/=10){  
      rev=10*rev+x%10;  
    }  
    return Math.abs(rev-n);  
  }  
}
```
